

CATCH SKIN CANCER BEFORE IT'S TOO LATE

LEARN MORE ABOUT THE BASICS OF
SKIN CANCER

DR. ANNEMIE VANDER STRAETEN

WHAT IS SKIN CANCER?

Skin cancer is the uncontrolled growth of abnormal skin cells, often due to DNA damage caused by ultraviolet radiation. Think of it like a garden where weeds suddenly start to overpower and damage your beautiful plants.

WHY EARLY DETECTION IS KEY?

Catching skin cancer early is akin to nipping a problem in the bud. When detected in the initial stages, treatment options are more effective, less invasive, and the chance of a full recovery is higher. In emergency medicine, there is something called the “golden hour”, where immediate treatment dramatically improves outcomes. The same applies to skin cancer; the sooner you catch it, the better.

MELANOMA

Melanoma originates from pigment-producing cells and is notorious for its ability to spread rapidly.

Picture it as a wildfire that, if not contained quickly, can rapidly devour a forest.

BASAL CELL CARCINOMA

Check your skin every three months to look for early signs of skin cancer.

This is the most common form of skin cancer. It often appears as pearly nodules and usually grows slowly. It can be very disfiguring if not treated timeously. They are raised, transparent, pearly nodules that form on the skin, usually on the face and other sun-exposed areas.

Imagine it as a weed in your garden that grows gradually but can become a nuisance if ignored.

SQUAMOUS CELL CARCINOMAS

This is the most common form of skin cancer. It often appears as pearly nodules and usually grows slowly. It can be very disfiguring if not treated timeously. They are raised, transparent, pearly nodules that form on the skin, usually on the face and other sun-exposed areas.

exam.*

*The Good News:
Skin Cancer is both
easy to identify and in
the early stages easy to
treat.
Just be Aware!*

MALIGNANT MELANOMAS

This is a type of cancer that develops from pigment containing cells. It can at first look like a freckle or an innocent mole that has been there for a long time, but a melanoma can appear anywhere on the skin. They can be small brown or black or larger, multi-coloured patches on the skin with an irregular outline. They may also become elevated, crusty and may even itch and bleed. But they all spread easily and are therefore the dreaded killers.

People who abused steroids to increase their sport performance are more at risk.

CAUSES AND RISK FACTORS

- SUN EXPOSURE

The sun is like a double-edged sword. While it provides vitamin D, its UV rays can harm your skin. Those who are frequently exposed to the sun are at a higher risk.

- FAMILY HISTORY

If cancer runs in your family, you have a higher chance of developing skin cancer yourself.

- PHYSICAL TRAITS

People with lighter skin, hair, and eyes are more susceptible to skin cancer.

- AGE AND GENDER

Older people and men are generally more susceptible.

A person wearing a long, flowing white dress is standing on a rocky shore. The person's feet are visible, and they appear to be barefoot. The background shows a calm body of water with ripples, and the sky is a soft, hazy color. The overall mood is serene and natural.

CHANGES SHOULD BE CHECKED!

Any new moles or any moles with changes (size, thickness, discolouration, bleeding or not healing, etc.) should be checked! If you find something that seems suspect to you, rather be on the safe side and have it checked out by your doctor.

THE ADCDE RULE

A for Asymmetry

(one side looks different to the other side.)

B for Borders

irregular, blurred or jagged.

C for Colour Variation

D for Diameter

larger than 6mm.

E for Evolving

over time.

SIGNS & SYMPTOMS

- New moles or changes in existing ones can be a red flag.
- Remember the ABCDE rule.
- Itchiness and Pain.
- Nodular Melanoma appearing.

The Nodular Melanoma is the most dangerous of them all. Look out for:

Elevated above the skin | Firm to the touch | Growing

PREVENTION TIPS

Routine Checks

- Regular skin checks are akin to maintaining your car; it might be running fine, but regular inspections can prevent bigger issues down the line.

Sun Protection

- Sunscreen is to your skin what an umbrella is to a rainstorm—a necessary shield.

Avoiding Tanning Beds

- Tanning beds are like fast food for your skin; they might offer short-term satisfaction but can cause long-term harm.

Healthy Diet

- Eating foods rich in antioxidants.

WHAT IS MOLE MAPPING?

Mole mapping uses photography to track any changes to your moles over time. These changes can include changes in the size, shape and colour of your moles, signs that a mole could potentially be turning cancerous. This technique is a useful tool for identifying skin cancers, called skin melanomas.

Benefits of Mole Mapping

Mole mapping serves as a comprehensive archive of your skin. Imagine it as a detailed map of a city, marking even the smallest alleys and changes over time.

Technology Behind Mole Mapping

Intricate software and high-definition imaging make mole mapping as advanced as satellite imagery, providing a detailed landscape of your skin.

HOW DR. ANNEMIE VANDER STRAETEN CAN HELP

Personalized Care Plans

Each treatment plan is unique, tailored to meet the individual needs of each patient, by using Mole Mapping Technique.

The Importance of Being Proactive

Proactive skin care is like investing for retirement. The earlier you start, the greater the long-term benefits.
